MONTENERO

A NEW SOLUTION FOR YOUR THIBEAU D.U.R. SYSTEM

Montenero develops a new solution for controlling the old D.U.R. electrical system.

Integrating the EGO 3500 SBD technology, the system solves all the problems related to reliability, controlling and starting.

COMPULSORY PARTS

1. Control Logic

The replacement of control cabinet and the drive systems offers the possibility of a direct control of the electrical fly comb, with regulation of the amplitude.

2. Electrical Motor

The single-phase electrical motor has to be substitute with Montenero designed brushless motor.

OPTIONAL PARTS

3. Torsion Bar

After above upgrade, in case of necessity, it is possible to substitute the original torsion bar with a new one, equipped with a special joint for the fixing in the clutch.

The mechanical characteristic of the fly comb will remain the same.

4. Pneumatic Clutch

The actual D.U.R. clutch can be upgraded with a pneumatic device, in order to control the working and parking position automatically (no manual operation).
